

# FIREBASE (DEPLOYMENT) + HOSTING

## • Steps for Hosting

- 1- Download Node JS
- 2- To check version of Node.  
i. Open CMD and type node -v command  
ii. To check npm type npm -v command
- 3- Open Fire base > get started
- 4- To install Firebase open CMD and type  
install Firebase.

① npm install -g firebase-tools

② 'firebase logout' to logout

If you want to  
changes in your  
website you have  
to run 'firebase deploy'  
again only

③ 'firebase login' to login.

public - yes  
github - no

After login type

④ 'firebase init'  
go to hosting (config files)

init means initialize

- It creates a folder 'public' in that process in which there is a default 'index.html'.

- Replace this files with your own files you want to deploy. (All files of your website)  
(Windows all files)

• Then type ⑤ 'firebase deploy' in CMD
